## In the claims:

1 to 16.(canceled)

17. (currently amended) A method for fabricating a leadframe comprising the steps of:

providing a copper leadframe having a mount pad for an integrated circuit chip and a

plurality of lead segments having their first end near said mount pad and their second end remote

from said mount pad;

cleaning said leadframe in alkaline soak cleaning and alkaline electrocleaning electrocleaning;

activating said leadframe by immersing said leadframe into an acid solution, thereby dissolving any copper oxide;

immersing said leadframe into an electrolytic nickel plating solution and depositing a first layer of nickel onto said copper;

electroplating a layer comprising an alloy of nickel and palladium;

electroplating a second layer of nickel, thereby adapting said lead segments for mechanical bending;

'electroplating a layer of palladium;

selectively masking said chip pad and said first segment ends, thereby leaving said second segment ends exposed; and

plating a layer of gold on said exposed segment ends in a thickness suitable to optimize solder attachment, thereby creating a visual distinction between the gold-plated and unplated leadframe areas.

18. (previously presented) The method according to Claim 17 wherein said gold plating is performed electrolytically or electrolessly.

- 19. (previously presented) The method according to Claim 17 wherein said masked parts of said leadframe comprise the leadframe areas to be encapsulated by molding compound.
- 20. (previously presented) The method according to Claim 17 wherein the process steps are executed in sequence without time delays, yet including intermediate rinsing steps.
- 21. (previously presented) The method according to Claim 17 wherein said acid solution may be sulfuric acid, hydrochloric acid or any other acid.
- 22. (currently amended) A method for fabricating a leadframe comprising the steps of: providing a copper leadframe having a mount pad for an integrated circuit chip and a plurality of lead segments having their first end near said mount pad and their second end relatively remote from said mount pad;

cleaning said leadframe in alkaline soak cleaning and alkaline <u>electro cleaning</u> electrocleaning;

activating said leadframe by immersing said leadframe into an acid solution to dissolve any copper oxide;

electroplating a layer of nickel to adapt said lead segments for mechanical bending; electroplating a layer of palladium;

selectively masking said chip pad and said first segment ends to leave said second segment ends exposed; and

plating a layer of gold on said exposed segment ends in a thickness suitable to optimize solder attachment to create a visual distinction between the gold-plated and unplated leadframe areas.
